Shaders & VFX Documentation

Shaders & VFXs

This documentation aims to provide a full documentation for all the shaders and Vfxs assets provided by 4H2C.

There is going to be one section per asset. Some packs might contain multiple of those assets. It is specified in the pack description.

State of the assets

 **Released : Wall see through**  100% Ready This asset aims to give you the tools to achieve a see through effect.

 Join our Discord to request features, share ideas, or give feedback. Your input helps shape the future of the toolkit!

 Not released yet : Vfx portals pack  10% Ready

 Not released yet : Skybox generator  10% Ready

More systems are going to be added

Have you ever wondered how those effects are made in Baldur's Gate or other games ? I mean seeing through walls.

Well thanks to this asset it's now easy.

Due to some bugs with Unity 6.0 & 6.1 in the shader graph this asset is only available starting in Unity 6.2. There is no work around to make it work in previous versions of the engine, because the engine was bugged.

Getting started

To use just look at the demo scene.

The control

There is already a prefab named **Cam_SeeThrough** it uses Cinemachine by default, but you can always remove its Cinemachine Brain if you don't wish to work with Cinemachine.

On this prefab there is the **PassThroughControl** MonoBehaviour. Its role is to control the feature. It pools materials, replaces the right materials etc...

You've got to give it your **Camera Transform**, a **Target Transform** to follow, the GameObject associated to this target transform, the **PassThrough Material**, the **Radius** of the hole and the **Allowed to be replaced** layers.

- For the radius the basic value is 1.5 you can increase it or lower it. Just note that this radius is decoupled from the one of the material.
- The allowed layer note that you should include the layer of your target.

The material

The material is made thanks to the shader graph. The shader is a fully functional URP_lit that includes the PassThrough SubShader. You can make your own system or shader including this node. Also do not hesitate to request more features.

I will not document the PBR part of the material since it's the same as the normal URPLit material, but I will explain the seethrough params.

After the **Emission** catégorie you get a **PassTrough** and a **Edge** category.

- The **PassThrough** controls the mask and the transparency.
 - **LookDirection** and **LookAtPosition** are controlled by the control script.
 - **TowardCam** Gives you control over the direction of the cone of dissolution.
 - **Threshold** Controls the Radius of the hole
- The **Edge** gives you control on the edges of the cut.

Anything you want.

I'm planning on adding some Vfx above the border. Maybe more features. Like a scans using dither to see object through walls like in splinter cells.

Anyway thanks for buying this asset.

Join the discord to request features. We'd love to meet you :D
