

Extension Utils Documentation

This package is pretty simple to use.

There should be no demo scene since it just helpers & extension methods.

We made the pack because we'd like to share the expension methods that we use often.

This pack is suceptible to grow.

To use this asset just put the assembly "ExtensionUtils" in your assemblies and you are good to go.

You can expect :

- Vector operator overload : yeah Vector2 + Vector3 is now possible
- You can do some texture blipping
- String/int time conversions
- Currency format
- System info
- Some I/O helpers
- A GetComponentInChildren that doesn't get itself
- Some data structure
- A way to get random number or shuffle collections
